SECP3106-01 APPLICATION DEVELOPMENT (WBL)

LAB ASSIGNMENT 1 :

DAILY ACTIVITIES RECORDER APP

LECTURER: DR. AHMAD NAJMI BIN AMERHAIDER NUAR

NAME	MATRIC NUMBER
SAFIYA NURSYAHADAH BINTI MASNOOR	A23CS0176

1.0 Objective

The objective of this assignment is to apply the basic concept of Flutter development learned in Lessons 1 to 3. This includes understanding Flutter project structure, using widgets for layout design, handling user input with TextField, managing state using setState(), and displaying data using ListView.

2.0 Brief Description

The Daily Activities Recorder is a simple Flutter mobile application that allows users to record and manage their daily activities. The system is intentionally kept simple, relying only on basic Flutter concepts without any database or complex state management.

The app provides the following core functionalities:

- Enter a daily activity name
- Enter the time or category of the activity
- Save the activity to a list
- Display all recorded activities on screen
- Delete any activity from the list

3.0 Explanation of the Interface

The interface is designed to be clean, simple, and user-friendly. It consists of the following main components :

3.1 Activity Name Input Field

This input field allows the user to enter the name of the activity. For example, users can type activities such as "Study", "Sleep", or "Skipping". It uses a TextField widget to capture user input.

3.2 Time/Category Input Field

This input field is used to enter either the time or category of the activity. For example, users can input "8:00 PM" or "Exercise". This also uses a TextField widget.

3.3 Add Activity Button

The Add button is used to save the activity entered by the user. When pressed, it triggers the onPressed function, which uses setState() to update the activity list and refresh the UI.

3.4 Activity List

The list of activities is displayed using a ListView widget. Each item in the list shows:

- Activity name
- Time or category

This allows users to easily view all recorded activities in one place.

3.5 Delete Button

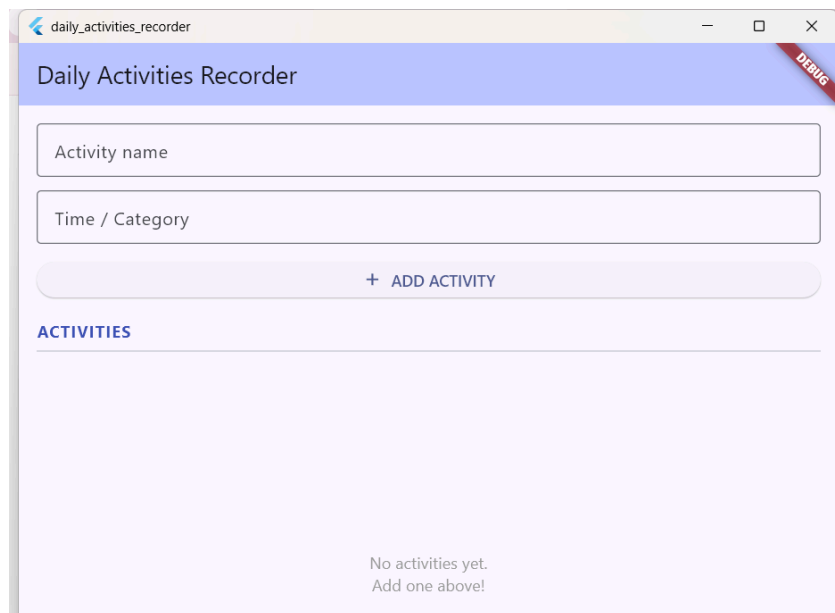

Each activity in the list has a Delete button. When pressed, the selected activity is removed from the list using setState(), and the interface updates automatically.

4.0 Screenshots of the App

The following screenshots illustrate the main screens of the Daily Activities Recorder app:

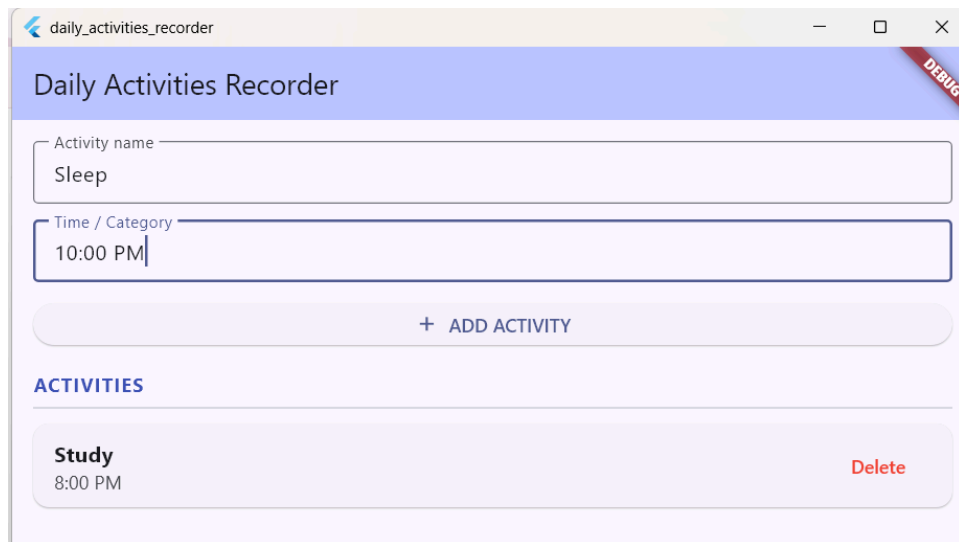

Screenshot 1 – Main Screen (Empty State)

Shows the app on launch with both input fields empty and no activities recorded yet.

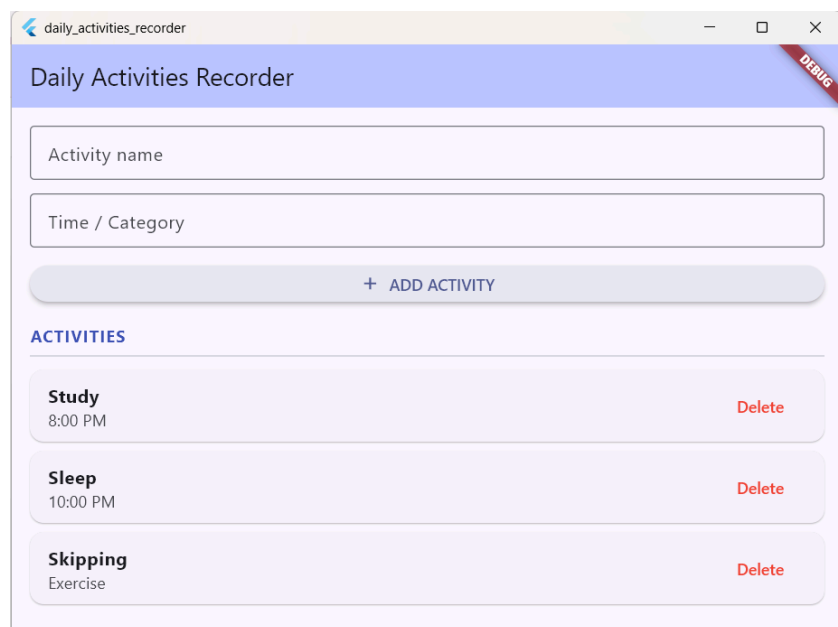

Screenshot 2 – Adding an Activity

Shows the user typing an activity name and time/category before pressing the ADD ACTIVITY button.

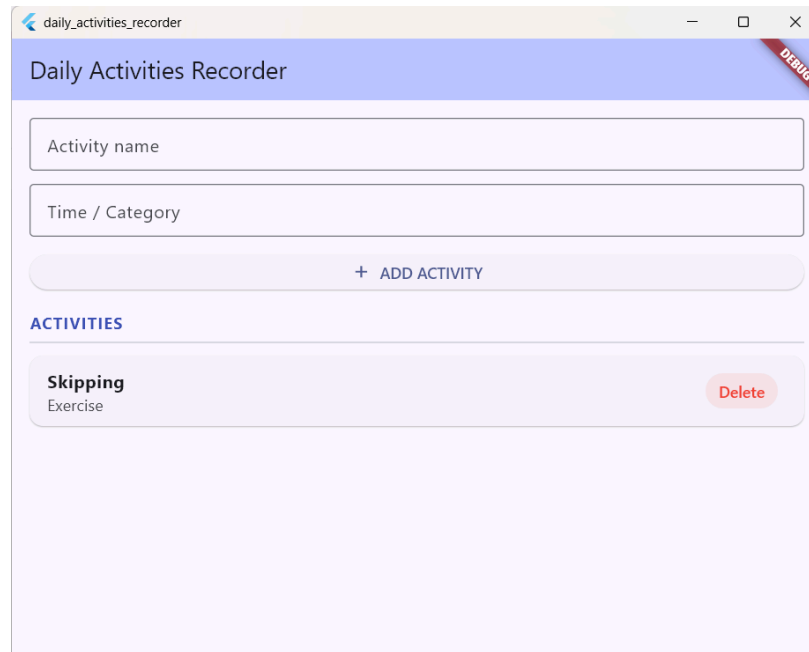

Screenshot 3 – Activities List

Shows multiple recorded activities displayed in the ListView with their respective Delete buttons.

Screenshot 4 – After Deletion

Shows the list after one or more activities have been deleted using the Delete button.

5.0 Conclusion

In conclusion, this assignment helped in understanding the fundamental concepts of Flutter development. The app successfully demonstrates how to collect user input, manage state using `setState()`, and dynamically update the user interface.

Through this project, important skills such as widget usage, layout design, and handling user interaction were developed. The Daily Activities Recorder App is simple but effective in showcasing the basics of mobile app development using Flutter.
